# 1 System Overview

This chapter contains the fundamental information for this module.

The component sections are as follows:

- [Introduction](#) – describes the main elements of the module.
- [Feature Check](#) – summarizes the main features of the module as bullet points.
- [Packages and Documents](#) – the *Packages* section lists the packages that you need in order to use this module. The *Documents* section lists the relevant user guides.
- [Change History](#) – lists the earlier versions of this manual, giving the software version that each manual describes.

**Note:** To download this manual as a PDF, see [USB Device PDFs](#).

## 1.1 Introduction

This guide is for those who want to implement an embedded USB class driver to control audio devices. The audio class driver enables the device to act as a microphone and/or speaker when connected to a USB host over USB.

The system structure is shown in the diagram below:

### Note:

- This module is part of HCC's Embedded USB Device (EUSBD) system, as described in the *HCC Embedded USB Device Base System User Guide*. This module communicates with the EUSBD base system through the EUSBD device interface, as described in the above manual.
- Other types of HCC class driver can be added to the system, for example CDC-ACM, mass storage, and printer. For the current list of supported class drivers, contact [sales@hcc-embedded.com](mailto:sales@hcc-embedded.com).

The package provides a set of API functions. The API description in this manual has separate sections describing module management and the audio functions.

## 1.2 Feature Check

The main features of the class driver are the following:

- Conforms to the HCC Advanced Embedded Framework.
- Designed for integration with both RTOS and non-RTOS based systems.
- Supports all devices that conform to the USB 1.0 audio interface specification.
- Supports the asynchronous, synchronous, and adaptive transfer modes.
- Compatible with sample device files produced by using the HCC USB Device Descriptor Generator.
- Uses a system of callbacks for user-specified events.

## 1.3 Packages and Documents

### Packages

The table below lists the packages that you need in order to use this module:

Package	Description
<b>hcc_base_doc</b>	This contains the two guides that will help you get started.
<b>usbd_base</b>	The USB device base package. This is the framework used by USB class drivers to communicate over USB using a specific USB device controller package.
<b>usbd_cd_audio</b>	The audio class driver described in this document.
<b>usbd_softmr</b>	The SOF timer event functions required by this class driver.
<b>util_ring_buffer</b>	The ring buffer utility.
<b>util_hcc_mem</b>	The HCC memory management utility.

### Documents

For an overview of HCC's embedded USB stacks, see [Product Information](#) on the main HCC website.

Readers should note the points in the [HCC Documentation Guidelines](#) on the HCC documentation website.

#### **HCC Firmware Quick Start Guide**

This document describes how to install packages provided by HCC in the target development environment. Also follow the *Quick Start Guide* when HCC provides package updates.

#### **HCC Source Tree Guide**

This document describes the HCC source tree. It gives an overview of the system to make clear the logic behind its organization.

#### **HCC Embedded USB Device Base System User Guide**

This document describes the Embedded USB Device base system.

#### **HCC USB Device Audio Class Driver User Guide**

This is this document.

#### **HCC USB Device Descriptor Generator User Guide**

This document describes the tool for creating USB descriptor files for inclusion in a project that uses the EUSBD stack.

## 1.4 Change History

This section describes past changes to this manual.

- To download this manual or a PDF describing an [earlier software version](#), see [USB Device PDFs](#).
- For the history of changes made to the package code itself, see [History: usbd\\_cd\\_audio](#).

The current version of this manual is 1.50. The full list of versions is as follows:

Manual version	Date	Software version	Reason for change
1.50	2019-02-21	3.06	Added USBD_AUDIO_VOLUME_INVALID section.
1.40	2018-10-11	3.04	Reorganized <i>Speaker Management</i> section to show the functions that depend on a configuration option being set.
1.30	2017-08-29	3.04	Corrected <i>Packages</i> list.
1.20	2017-06-16	3.04	New <i>Change History</i> format.
1.10	2016-04-21	3.04	Added function group descriptions to API.
1.00	2015-04-17	3.04	First release.

## 2 Source File List

This section describes all the source code files included in the system. These files follow the HCC Embedded standard source tree system, described in the [HCC Source Tree Guide](#). All references to file pathnames refer to locations within this standard source tree, not within the package you initially receive.

**Note:** Do not modify any files except the configuration files.

### 2.1 API Header Files

These files in the directory **src/api** are the only files that should be included by an application using this module. For details of the API functions, see [Application Programming Interface](#).

File	Description
<b>api_usbd_audio.h</b>	Base audio module API.
<b>api_usbd_audio_map.h</b>	Audio map API.
<b>api_usbd_mic.h</b>	Microphone API.
<b>api_usbd_speaker.h</b>	Speaker API.

### 2.2 Configuration Files

These files in the directory **src/config** contain all the configurable parameters of the system. Configure these as required. For details of these options, see [Configuration Options](#).

File	Description
<b>config_usbd_audio.h</b>	Base audio configuration file.
<b>config_usbd_mic.h</b>	Microphone configuration file.
<b>config_usbd_speaker.h</b>	Speaker configuration file.

## 2.3 Source Code Files

These files are in the directory `src/usb-device/class-drivers/audio`. These files should only be modified by HCC.

File	Description
<code>usbd_audio.c</code>	Audio device source code.
<code>usbd_audio.h</code>	Audio header file.
<code>usbd_audio_feat_unit.c</code>	Feature unit control code.
<code>usbd_audio_feat_unit.h</code>	Feature unit control header file.
<code>usbd_audio_map.c</code>	Audio map source code.
<code>usbd_audio_map.h</code>	Audio map header file.
<code>usbd_fifo_init.c</code>	FIFO source code.
<code>usbd_fifo_init.h</code>	FIFO header file.
<code>usbd_mic.c</code>	Microphone source code.
<code>usbd_mic.h</code>	Microphone header file.
<code>usbd_speaker.c</code>	Speaker source code.
<code>usbd_speaker.h</code>	Speaker header file.

## 2.4 Version File

The file `src/version/ver_usbd_audio.h` contains the version number of this module. This version number is checked by all modules that use this module to ensure system consistency over upgrades.

## 3 Configuration Options

Set the system configuration options in the three configuration files described in this section. The available configuration options and their default values are described.

### 3.1 Audio Configuration

Set the audio configuration options in the file **src/config/config\_usb\_audio.h**.

#### **AUDIO\_MIC\_SUPPORT**

Set this to 0 if microphone support is not needed. The default is 1.

#### **AUDIO\_SPK\_SUPPORT**

Set this to 0 if speaker support is not needed. The default is 1.

#### **USB\_AUDIO\_MAX\_NO\_OF\_CHANNELS**

The number of audio channels supported by the audio streams (left, right, and so on). The default is 2.

### 3.2 Microphone Configuration

Set the single microphone configuration option in the file **src/config/config\_usb\_mic.h**.

#### **USB\_MIC\_BUFFER\_PER\_EP**

The number of packets the audio sample FIFO can hold. The default is 4.

### 3.3 Speaker Configuration

Set the speaker configuration options in the file **src/config/config\_usb\_speaker.h**.

#### **USB\_SPK\_BUFFER\_PER\_EP**

The number of packets the audio sample FIFO can hold. The default is 4.

#### **USB\_SPK\_SR\_REFRESH\_PERIOD**

The sample rate refresh period. The default is 0. There are two options:

- Synchronization type 1 (for proper operation, use this) – defines a synchronization endpoint for an audio stream to notify the host of the actual sampling rate. Set this parameter to non-zero to use this. The value specified must match the periodicity of this endpoint.
- Disable type 1 synchronization (the default) – the device performs its own sample rate synchronization, dropping or repeating samples when needed. Use this if no synchronization endpoint is defined.

**USB\_SPK\_VOLUME\_UNIT\_ID**

The unit ID of the feature unit which is responsible for the speaker's volume control. Set this to 0 (the default) to disable volume control.

**USB\_SPK\_VOLUME\_MIN**

If volume control is enabled, this is the minimum volume level supported by the device. The value is a signed fixed point number where the fractional part is 8 bits wide. The default is 0x0000 (0dB).

**USB\_SPK\_VOLUME\_MAX**

If volume control is enabled, this is the maximum volume level supported by the device. The value is a signed fixed point number where the fractional part is 8 bits wide. The default is 0x1500 (21dB).

**USB\_SPK\_VOLUME\_RES**

If volume control is enabled, this is the resolution it uses. The value is a signed fixed point number where the fractional part is 8 bits wide. The value must be greater than or equal to zero. The default is 0x0100 (1dB).

## 4 Application Programming Interface

This section documents the Application Programming Interface (API). It includes all the functions that are available to an application program.

### 4.1 Module Management

The functions are the following:

Function	Description
<b>usbd_audio_init()</b>	Initializes the module and allocates the required resources.
<b>usbd_audio_start()</b>	Starts the module.
<b>usbd_audio_stop()</b>	Stops the module.
<b>usbd_audio_delete()</b>	Deletes the module and releases the resources it used.

## usbd\_audio\_init

Use this function to initialize the audio class driver and allocate the required resources.

**Note:** You must call this before any other function.

### Format

```
int usbd_audio_init ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
USB_AUDIO_SUCCESS	Successful execution.
USB_AUDIO_ERROR	Operation failed.

## usbd\_audio\_start

Use this function to start the audio class driver.

**Note:** You must call **usbd\_audio\_init()** before this function to initialize the module.

### Format

```
int usbd_audio_start ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
USB_AUDIO_SUCCESS	Successful execution.
USB_AUDIO_ERROR	Operation failed.

## usbd\_audio\_stop

Use this function to stop the audio class driver.

### Format

```
int usbd_audio_stop ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
USB_AUDIO_SUCCESS	Successful execution.
USB_AUDIO_ERROR	Operation failed.

## usbd\_audio\_delete

Use this function to remove the class driver and release the associated resources.

### Format

```
int usbd_audio_delete ( void )
```

### Arguments

Argument
None.

### Return Values

Return value	Description
USB_AUDIO_SUCCESS	Successful execution.
USB_AUDIO_ERROR	Operation failed.

## 4.2 Packet Size Management

The functions are the following:

Function	Description
<b>get_pkt_size_in()</b>	Returns the packet size of the specified input stream (microphone).
<b>get_pkt_size_out()</b>	Returns the packet size of the specified output stream (speaker).

## get\_pkt\_size\_in

Use this function to return the packet size of the specified input stream (microphone).

### Format

```
unsigned short get_pkt_size_in ( unsigned char stream )
```

### Arguments

Parameter	Description	Type
stream	The stream ID.	unsigned char

### Return Values

Return value	Description
The packet size.	Successful execution.
USB_AUDIO_ERROR	Operation failed.

## get\_pkt\_size\_out

Use this function to return the packet size of the specified output stream (speaker).

### Format

```
unsigned short get_pkt_size_out ( unsigned char stream )
```

### Arguments

Parameter	Description	Type
stream	The stream ID.	unsigned char

### Return Values

Return value	Description
The packet size.	Successful execution.
USB_AUDIO_ERROR	Operation failed.

## 4.3 Microphone Management

The functions are the following:

Function	Description
<b>usbd_mic_get_in_stream()</b>	Returns a pointer to the FIFO of the specified audio stream.
<b>usbd_mic_get_sr()</b>	Finds the sample rate set by the host.
<b>usbd_mic_is_active()</b>	Finds whether the specified microphone stream is active.
<b>usbd_mic_set_onoff_notify()</b>	Registers a callback function that is called when the microphone is activated or deactivated.
<b>usbd_mic_set_sr_notify()</b>	Registers a callback function that is called when the host changes the sample rate of the microphone.

## usbd\_mic\_get\_in\_stream

Use this function to return a pointer to the FIFO of the specified audio stream.

### Format

```
rngbuf_t * usbd_mic_get_in_stream ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
USB_AUDIO_SUCCESS	Successful execution.
USB_AUDIO_ERROR	Operation failed.

## usbd\_mic\_get\_sr

Use this function to find the sample rate set by the host.

This function can be called from the sample rate change notification callback to get the new value.

### Format

```
uint32_t usbd_mic_get_sr ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
USBDAUDIO_SUCCESS	Successful execution.
USBDAUDIO_ERROR	Operation failed.

## usbd\_mic\_is\_active

Use this function to find whether the specified microphone stream is active.

### Format

```
int usbd_mic_is_active ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
0	Stream is inactive.
Non-zero	Stream is active.

## usbd\_mic\_set\_onoff\_notify

Use this function to register a callback function which is called when the microphone is activated or deactivated.

**Note:** It is the user's responsibility to provide any callback functions required by the application. Providing such functions is optional.

### Format

```
void usbd_mic_set_onoff_notify (  
    int (* fn )( uint32_t param ),  
    uint32_t param )
```

### Arguments

Parameter	Description	Type
fn	A pointer to the callback function.	int *
param	The value of the parameter passed to the callback.	uint32_t

### Return Values

Return value	Description
USBDAUDIO_SUCCESS	Successful execution.
USBDAUDIO_ERROR	Operation failed.

## usbd\_mic\_set\_sr\_notify

Use this function to specify a callback function which is called when the host changes the sample rate of the microphone.

**Note:** It is the user's responsibility to provide any callback functions required by the application. Providing such functions is optional.

### Format

```
void usbd_mic_set_sr_notify (  
    int (* fn )( uint32_t param ),  
    uint32_t param )
```

### Arguments

Parameter	Description	Type
fn	A pointer to the callback function.	int *
param	The value of the parameter passed to the callback.	uint32_t

### Return Values

Return value	Description
USB_D_AUDIO_SUCCESS	Successful execution.
USB_D_AUDIO_ERROR	Operation failed.

## 4.4 Speaker Management

The functions are the following:

Function	Description
<b>usbd_spk_get_out_stream()</b>	Returns a pointer to the FIFO of the audio stream assigned to the specified stream.
<b>usbd_spk_is_active()</b>	Determines whether the specified speaker stream is active.
<b>usbd_spk_set_sr_notify()</b>	Registers a callback function that is called when the host changes the sample rate of the speaker.
<b>usbd_spk_get_sr()</b>	Gets the sample rate set by the host.
<b>usbd_spk_set_onoff_notify()</b>	Registers a callback function that is called when the speaker is activated or deactivated.
The following is only available if USBD_SPK_SR_REFRESH_PERIOD is set (this is not the default).	
<b>usbd_spk_set_synch_rate()</b>	Tells the USB host the actual sample rate.
The following are only available if USBD_SPK_VOLUME_UNIT_ID is set (this is not the default).	
<b>usbd_spk_get_volume_info()</b>	Returns a pointer to an array that holds the current volume level of all audio channels.
<b>usbd_spk_get_mute_info()</b>	Returns a pointer to an array that holds the mute states of all audio channels.
<b>usbd_spk_set_mute_notify()</b>	Registers a callback function that is called when the host mutes or unmutes any audio channel.
<b>usbd_spk_set_volume_notify()</b>	Registers a callback function that is called when the host changes the volume level of any audio channel.

## usbd\_spk\_get\_out\_stream

Use this function to return a pointer to the FIFO of the audio stream assigned to the specified stream.

The FIFO can be used to receive audio samples from the host.

### Format

```
rngbuf_t * usbd_spk_get_out_stream ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
USBDAUDIO_SUCCESS	Successful execution.
USBDAUDIO_ERROR	Operation failed.

## usbd\_spk\_is\_active

Use this function to determine whether the specified speaker stream is active.

### Format

```
int usbd_spk_is_active ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
0	The speaker stream is inactive
Non-zero.	The speaker stream is active.

## usbd\_spk\_set\_sr\_notify

Use this function to specify a callback function which is called when the host changes the sample rate of the speaker.

**Note:** It is the user's responsibility to provide any callback functions required by the application. Providing such functions is optional.

### Format

```
void usbd_spk_set_sr_notify (  
    int (* fn )( uint32_t param ),  
    uint32_t param )
```

### Arguments

Parameter	Description	Type
fn	A pointer to the callback function.	int *
param	The value of the parameter passed to the callback.	uint32_t

### Return Values

Return value	Description
USBBD_AUDIO_SUCCESS	Successful execution.
USBBD_AUDIO_ERROR	Operation failed.

## usbd\_spk\_get\_sr

Use this function to get the sample rate set by the host.

This function can be called from the sample rate change notification callback to get the new value.

### Format

```
uint32_t usbd_spk_get_sr ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
USBDAUDIO_SUCCESS	Successful execution.
USBDAUDIO_ERROR	Operation failed.

## usbd\_spk\_set\_onoff\_notify

Use this function to register a callback function which is called when the speaker is activated or deactivated.

**Note:** It is the user's responsibility to provide any callback functions required by the application. Providing such functions is optional.

### Format

```
void usbd_spk_set_onoff_notify (  
    int (* fn )( uint32_t param ),  
    uint32_t param )
```

### Arguments

Parameter	Description	Type
fn	A pointer to the callback function.	int *
param	The value of the parameter passed to the callback.	uint32_t

### Return Values

Return value	Description
USBDAUDIO_SUCCESS	Successful execution.
USBDAUDIO_ERROR	Operation failed.

## usbd\_spk\_set\_synch\_rate

Use this function to tell the USB host the actual sample rate.

The reported value is used by the host during sample rate synchronization.

**Note:** This function is only available if sample rate [synchronization type 1](#) is enabled.

### Format

```
void usbd_spk_set_synch_rate ( uint32_t rate )
```

### Arguments

Parameter	Description	Type
rate	Returns the sample rate.	uint32_t

### Return Values

Return value	Description
USBDAUDIO_SUCCESS	Successful execution.
USBDAUDIO_ERROR	Operation failed.

## usbd\_spk\_get\_volume\_info

Use this function to get a pointer to an array that holds the current volume level for all audio channels.

The array has [USB\\_AUDIO\\_MAX\\_NO\\_OF\\_CHANNELS](#) elements.

**Note:** This is only available if `USB_SPK_VOLUME_UNIT_ID` is set (this is not the default).

### Format

```
uint16_t * usbd_spk_get_volume_info ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
<code>USB_AUDIO_SUCCESS</code>	Successful execution.
<a href="#">USB_AUDIO_VOLUME_INVALID</a>	Invalid volume; click the link for details.
<code>USB_AUDIO_ERROR</code>	Operation failed.

## usbd\_spk\_get\_mute\_info

Use this function to get a pointer to an array that holds the mute states for all audio channels.

The number of elements in the array is [USBD\\_AUDIO\\_MAX\\_NO\\_OF\\_CHANNELS](#).

**Note:** This is only available if `USBD_SPK_VOLUME_UNIT_ID` is set (this is not the default).

### Format

```
uint8_t * usbd_spk_get_mute_info ( void )
```

### Arguments

Parameter
None.

### Return Values

Return value	Description
<code>USBD_AUDIO_SUCCESS</code>	Successful execution.
<code>USBD_AUDIO_ERROR</code>	Operation failed.

## usb\_spk\_set\_mute\_notify

Use this function to specify a callback function which is called when the host mutes or unmutes any audio channel.

### Note:

- This is only available if USBD\_SPK\_VOLUME\_UNIT\_ID is set (this is not the default).
- It is the user's responsibility to provide any callback functions required by the application. Providing such functions is optional.

### Format

```
void usb_spk_set_mute_notify (
    int (* fn)( uint32_t param ),
    uint32_t param )
```

### Arguments

Parameter	Description	Type
fn	A pointer to the callback function.	int *
param	The value of the parameter passed to the callback.	uint32_t

### Return Values

Return value	Description
USB_AUDIO_SUCCESS	Successful execution.
USB_AUDIO_ERROR	Operation failed.

## usbd\_spk\_set\_volume\_notify

Use this function to specify a callback function which is called when the host changes the volume level of any audio channel.

**Note:**

- This is only available if USBD\_SPK\_VOLUME\_UNIT\_ID is set (this is not the default).
- It is the user's responsibility to provide any callback functions required by the application. Providing such functions is optional.

**Format**

```
void usbd_spk_set_volume_notify (  
    int (* fn)( uint32_t param ),  
    uint32_t param )
```

**Arguments**

Parameter	Description	Type
fn	A pointer to the callback function.	int *
param	The value of the parameter passed to the callback.	uint32_t

**Return Values**

Return value	Description
USBDAUDIO_SUCCESS	Successful execution.
USBDAUDIO_ERROR	Operation failed.

## 4.5 Error Codes

If a function executes successfully it returns with `USBD_AUDIO_SUCCESS`, a value of zero.

Return Value	Value	Description
<code>USBD_AUDIO_SUCCESS</code>	0	Successful execution.
<code>USBD_AUDIO_ERROR</code>	1	Operation failed.

## 4.6 Types and Definitions

This section describes the `USBD_AUDIO_VOLUME_INVALID` define from the API header file.

### USBD\_AUDIO\_VOLUME\_INVALID

This is used to report an invalid volume. It is used with `usbd_spk_get_volume_info()` to report channels that do not receive any volume control from the host.

Hosts running Android do not send volume control commands to USB speakers when changing volume during playback. They change the outgoing stream data instead, according to the volume set by the user. Android sets audio volume once, after detecting the connection of an audio device. Also it only sets audio volume for one channel, even if the device implements two channels.

`USBD_AUDIO_VOLUME_INVALID` has been introduced to inform the application whether a channel has received a valid volume control command or not (when it calls `usbd_spk_get_volume_info()`). The application can decide how to interpret the described case. For example, if volume control information is available for the left channel but not for the right channel, it can decide to use the left channel's volume level on both channels, or to mute the right channel.

## 5 Integration

This section specifies the elements of this package that need porting, depending on the target environment.

### 5.1 PSP Porting

The Platform Support Package (PSP) is designed to hold all platform-specific functionality, either because it relies on specific features of a target system, or because this provides the most efficient or flexible solution for the developer. For full details of its functions, see the *HCC Base Platform Support Package User Guide*.

The audio module makes use of the following standard PSP functions:

Function	Package	Component	Description
<b>psp_memcpy()</b>	psp_base	psp_string	Copies a block of memory. The result is a binary copy of the data.
<b>psp_memset()</b>	psp_base	psp_string	Sets the specified area of memory to the defined value.
